

Required Report: Required - Public Distribution

Date: February 04,2020

Report Number: AS2019-0026

Report Name: Agricultural Biotechnology Annual

Country: Australia

Post: Canberra

Report Category: Biotechnology and Other New Production Technologies

Prepared By: Lindy Crothers

Approved By: Levin Flake

Report Highlights:

The Australian federal government is supportive of biotechnology and has committed considerable long-term funding to research and development. The Australian Productivity Commission recently completed an inquiry into the regulatory burden on farm businesses focusing on regulations that have a material impact on the competitiveness and productivity of Australian agriculture, including the impact of regulations for genetically engineered products. Technical reviews of the Gene Technology Regulations 2001 and the relevant Standard of the Food Standards Code are currently being finalized to provide regulatory clarity involving new technologies. The South Australian government introduced regulations to remove the moratorium on growing, transporting or selling genetically engineered crops in that state as of January 1, 2020. From this date GE crops can be grown in all areas of the state except Kangaroo Island.

REPORT OUTLINE

Executive Summary

Plant and Animal Biotechnology

CHAPTER 1: PLANT BIOTECHNOLOGY

PART A: Production and Trade

PART B: Policy

PART C: Marketing

CHAPTER 2: ANIMAL BIOTECHNOLOGY

PART D: Production and Trade

PART E: Policy

PART F: Marketing

EXECUTIVE SUMMARY

The United States has substantial interest in Australia's policies and regulatory framework regarding agricultural biotechnology and products derived thereof because of the potential impact to U.S. exports. Unprocessed (whole) biotech corn and soybeans have not received regulatory approval in Australia and cannot be imported without further processing. Foods with biotech content of over one percent must receive prior approval and be labeled, which has the potential of restricting sales of U.S. intermediate and processed products. Australia's policies and views on this technology influences other countries, which may potentially lead them to developing a similar regulatory system.

The biotech debate remains important in Australia. The federal government is very supportive of the technology, has committed considerable long-term funding to research and development, and approved biotech products like GE cotton, carnations and canola varieties for general release. The state governments have also committed funds for research and development. Initially most states were cautious about the introduction of the technology and initially put in place moratoria on new plantings of specific biotechnology crops. However, after several state-level reviews, New South Wales (NSW), Victoria, and Western Australia have lifted their moratoria on producing GE canola. South Australia signaled its intention to lift its moratorium in August 2019. Moratoria remain in place in Tasmania (just extended to 2029) and the Australian Capital Territory. Queensland and the Northern Territory do not have moratoriums in place.

For GE products that have not received regulatory approval in Australia, U.S. export opportunities are obviously restricted. The commercial impact to the United States of this constraint is most pronounced for feed grains, e.g. whole corn and soybeans. In addition to this market access restriction, Australia does not allow the importation of many grains and/or grain products for phytosanitary reasons, citing the need to limit exotic weed seeds.

CHAPTER 1: PLANT BIOTECHNOLOGY

The Gene Technology Act 2000 distinguishes between genetically modified organisms (GMOs) and genetically modified (GM) products. A genetically modified product – “GM product” (referred to as GE product throughout this report) is a product derived or produced from a “GMO” (Section 10 of the Gene Technology Act).

PART A: PRODUCTION AND TRADE

a) PRODUCT DEVELOPMENT: The [Commonwealth Scientific and Industrial Research Organization](#) (CSIRO) is currently undertaking research on a range of other [techniques](#) in the areas of agriculture, biosecurity and environmental sciences. Examples include:

- [RNAi](#) (gene silencing) – Projects include breeding wheat varieties with beneficial traits; increasing aquaculture productivity; virus-resistant plants; healthier cottonseed oil; and better biofuels.
- [Marker-assisted breeding](#) – Projects include: protecting wine grapes from mildew; and, helping cattle breeders select for hornless cattle.
- [Genetic Modification](#) – Projects include: Bt cotton; DHA canola; SHO safflower; Leaf oil; Bt cowpeas.

See table in Annex A for a list of products approved for field trials.

b) COMMERCIAL PRODUCTION: Biotech cotton, canola, and carnations are the only crops approved for commercial release by Australia’s Gene Technology Regulator (the Regulator). It is estimated that biotech cotton varieties are grown on almost all of Australia’s cotton area. The Regulator approved the commercial releases of two biotech canola varieties in 2003. In 2008 GE canola was grown commercially for the first time in Australia following the lifting of the moratoria in New South Wales and Victoria. In November 2008, Western Australia (WA) lifted its ban to allow biotech cotton to be grown in the Ord River region, and in April 2009, WA announced that trials of GE canola would be allowed at 20 sites in that state. In October 2016 WA repealed the 2003 *GM Free Areas Bill*, thus allowing approved GE crops to be grown freely in that State.

After a change of government in the March 2018 elections, the South Australian government undertook an [independent review](#) of the moratorium in that state. As a result of this review, in August 2019 the [government of South Australia](#) announced that it intended to lift the ban on growing GE crops in all areas of the state except Kangaroo Island. The statutory consultation period ended on September 30, 2019. Draft regulations are proposed to come into operation on December 1, 2019 to enable producers to make decisions regarding their plantings in 2020. Further information on the process can be found at: https://www.pir.sa.gov.au/primary_industry/genetically_modified_gm_crops.

At the same time South Australia was announcing the end to its moratorium, the Tasmanian government approved an extension of the state’s moratorium on GE food crops until 2029. Tasmania, and the Australian Capital Territory (ACT) are now the only states that have a moratorium on growing any GE crops while NSW maintains a moratorium on the growing of GE food crops. Major farm groups and the

Commonwealth government's science organizations do not support this position and have argued openly for acceptance of biotech crops.

In 2016/17 the [Australian Productivity Commission](#) undertook a public inquiry into the regulatory burden on farm businesses. The inquiry focused on regulations that have a material impact on the competitiveness and productivity of Australian agriculture, with the aim of defining priority areas for removing or reducing unnecessary regulatory burdens on farm businesses, and identifying unnecessary restrictions on competition. Two of the recommendations are of relevance to agricultural biotechnology (see Part B Policy).

In 2006, biotech carnations became the first biotech product to be assessed by the Regulator to “pose minimal risks to people or the environment, and are sufficiently safe to be used by anyone without the need for a license.” They have accordingly been placed on the “GMO” Register.

A full list of GE crops authorized for commercial release can be found at:
<http://www.ogtr.gov.au/internet/ogtr/publishing.nsf/Content/cr-1>.

Biotech Cotton

Biotech cotton has been grown commercially in Australia since the approval and introduction of the first GE variety in 1996. Almost 100 percent of the Australian cotton crop is made up of GE varieties. In addition, there are several new biotech cotton varieties currently being developed (see section on approvals in the Part B of this report).

Canola

Since 2003 many biotech canola varieties have been approved by OGTR. The first commercial plantings of these varieties took place in 2008 after the state governments in NSW and Victoria lifted their moratoria on commercial plantings of GE canola. In 2009 Western Australia allowed trials to begin and the first commercial plantings began in 2010. From 2020 South Australian farmers will be able to choose to grow GE canola as well. GE canola varieties now made up approximately 24 percent of the total national canola crop in 2017 (see below - latest figures available).

Total GE Canola by Year (hectares)

	2009	2010	2011	2012	2013	2014	2015†	2016†	2017†
NSW	13,930	23,286	28,530	40,324	31,573	52,000	51,870	54,970	68,163
Vic	31,186	39,405	22,272	19,012	21,232	37,000	47,137	47,069	56,900
WA		86,006	94,800	121,694	167,596	260,000	337,527	344,188	366,466
National	45,116	148,697	145,602	181,030	222,414	349,000	436,534	446,226	491,528
Total Area of Canola (GE and non GE)	1,390,000	1,590,500	1,815,000	2,687,000	2,480,000	2,607,000	2,000,000*	2,125,000*	2,080,000*
% GE Canola	3%	9%	8%	7%	9%	13%	22%*	21%*	24%*

† The seeding rate is 2.5 Kg/Ha from 2009 to 2014 and 2.0 Kg/Ha from 2015 onwards. Improved crop genetics, vigor and establishment help contribute towards a lower seeding rate over time.

* The 2015, 2016 and 2017 total area figure represents those states that grow GM canola only (WA, VIC and NSW).

Source: Agricultural Biotechnology Council of Australia

Total GE Canola by State (%)

	2009	2010	2011	2012	2013	2014	2015	2016	2017
NSW	6%	8%	7%	5%	5%	9%	11%	10%	11%

WA	0%	10%	12%	13%	14%	21%	30%	28%	34%
National	3%	9%	8%	10%	9%	13%	22%*	21%*	24%*

* The 2015, 2016 and 2017 total area/national figure represents those states that grow GM canola only (WA, VIC and NSW)

c) EXPORTS: Given that almost 100 percent of Australia’s cotton products come from GE varieties, it is more than likely that almost all exports of cotton and cotton products are GE varieties. Australia does not export cotton to the United States.

The Australian Department of Agriculture maintains an online Manual of Importing Country Requirements ([MICoR](#)) for meat, dairy, fish, live animals, plants and eggs and non-prescribed goods (honey, processed foods). This database list whether importing countries require a biotech declaration.

d) IMPORTS: Under the Gene Technology Act 2000, approval or authorization must be obtained to manage “GMOs.” Importers need to apply to OGTR for a license or authorization to import any GE materials into Australia. OGTR and the Department of Agriculture work closely to regulate and enforce this requirement. The application form for an import permit (for any product) contains a section relating to the GE status of the product. When importing GE seed/grain or seed/grain that is known to be mixed with any amount of a GE material, the importer is required to notify the Department of Agriculture by marking “yes” at the appropriate question in the Application for Permit to Import Quarantine Material. The permit application form also requires importers to provide details of the relevant authorization under the Act (e.g. OGTR license number of Notifiable Low Risk Dealings (NLRD), identifier number and name of assessing Institutional Biosafety Committee (IBC)). To verify authorizations, the Department of Agriculture and the OGTR work together to corroborate the submitted information.

Foods containing biotech materials must be approved by Food Standards Australia New Zealand and be labeled if the biotech content is greater than one percent before they can be sold in Australia. This applies to all domestically produced and imported food. A list of currently approved biotech food products is contained in [Standard 1.5.2](#).

Processed animal feeds such as soy meal are not covered by biotech legislation in Australia. These products, therefore, do not require prior approval or a license (see Part B of this report) to be imported. There are, however, quarantine restrictions on some products. Unprocessed biotech products imported as feed (i.e. whole grain, etc.), would require a license from OGTR, as there is a possibility that seed could be released into the environment.

e) FOOD AID: Australia does not provide any direct food aid. The [Australian Department of Foreign Affairs and Trade](#) provides immediate humanitarian food assistance through agencies such as the World Food Program and the FAO.

f) TRADE BARRIERS: See Part B, paragraph g) below on labeling requirements.

PART B: POLICY

a) REGULATORY FRAMEWORK: The *Gene Technology Act 2000* (the Act) came into force on June 21, 2001 as the Commonwealth component of a national regulatory scheme. The Act and the associated Gene Technology Regulations 2001, provide a comprehensive process for the Gene Technology Regulator to assess proposed dealings with live and viable “GMOs” ranging from contained work in certified laboratories to general releases of GE organisms into the environment, and extensive powers to monitor and enforce license conditions. An Inter-Governmental Agreement between the Commonwealth, states, and territories, underpins the system for regulating GE organisms in Australia. The Legislative and Governance Forum on Gene Technology (LGFGT), comprises ministers from the Commonwealth and each state and territory and provides broad oversight of the regulatory framework and guidance on matters of policy that underpin the legislation. High level support is provided to the LGFGT by the Gene Technology Standing Committee, which comprises senior officials from all jurisdictions.

The object of the Gene Technology Act is: "To protect the health and safety of people, and to protect the environment, by identifying risks posed by or as a result of gene technology, and by managing those risks through regulating certain dealings with genetically modified organisms."

The Act prohibits all dealings with “GMOs” unless the dealing is:

- A licensed dealing;
- A notifiable low risk dealing;
- Included on the “GMO” Register; and
- Specified in an Emergency Dealing Determination.

Key features of the Act are the appointment of an independent Gene Technology Regulator and a requirement for transparent and accountable implementation. The Regulator administers the regulation

of all dealings with “GMOs” in Australia, in accordance with the Act and ensures compliance with the conditions of any approvals. The Regulator consults extensively with the community, research institutions, and private enterprise.

Functions of the Gene Technology Regulator

The Gene Technology Regulator liaises with other regulatory agencies to coordinate the approval of biotech products for use and sale (see table below). The Act creates a Public Record of “GMO” Dealings and GE Products that resides on the OGTR website: www.ogtr.gov.au.

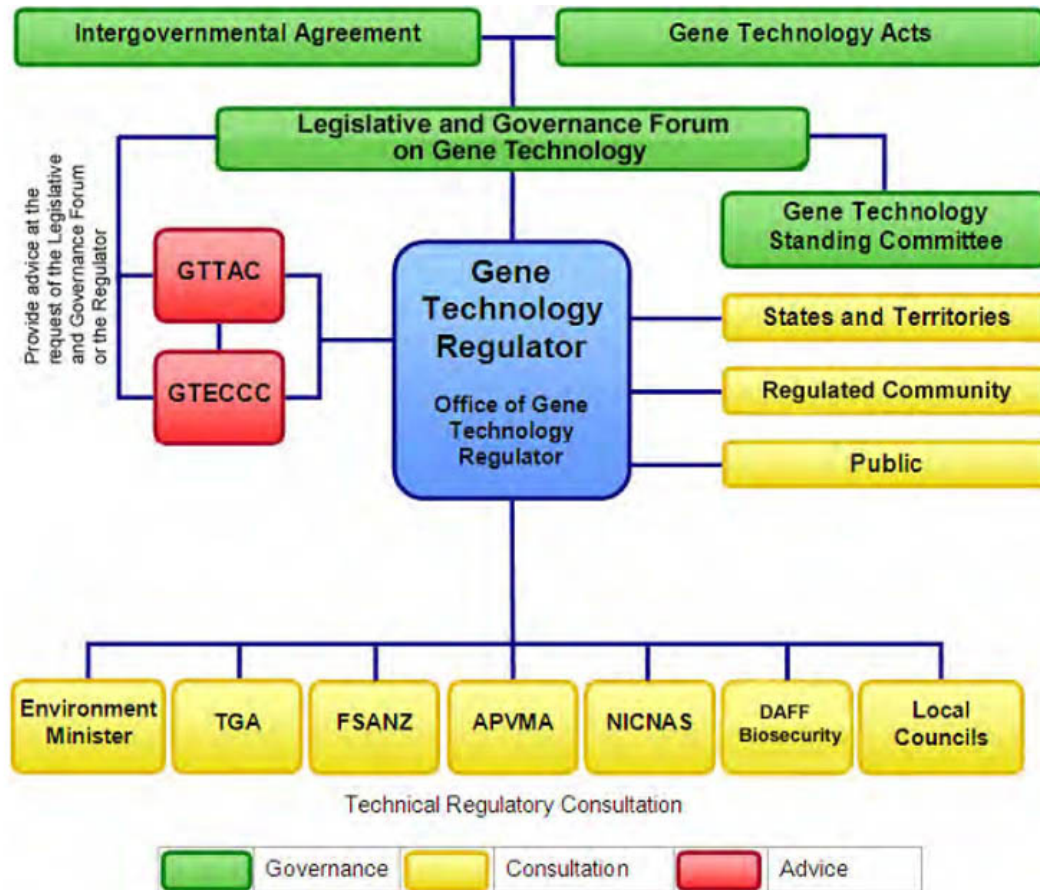

Regulatory Agencies in Australia with a Role in Regulation of Gene Technology

Agency	What They Regulate	Scope
<u>OGTR</u> – Office of the Gene Technology Regulatory (supporting the Gene Technology Regulator)	Dealings with “GMOs”	The Gene Technology Regulator administers a national scheme for the regulation of “GMOs” in Australia in order to protect health and safety of people, and to protect the environment, by identifying risks posed by or as a result of gene technology, and by managing those risks through regulating certain dealings with “GMOs.”
<u>TGA</u> – Therapeutic Goods Administration	Human Therapeutics	TGA administers legislation that provides a national framework for the regulation of medicines, medical devices, blood and tissues in Australia, including GE and “GM”-derived therapeutic products, and ensures their quality, safety and efficacy.
<u>FSANZ</u> – Food Standards Australia New Zealand	Human Food	FSANZ is responsible for setting standards for the safety, content and labeling of food. FSANZ conducts mandatory pre-market safety assessments for food produced using gene technology.
<u>APVMA</u> – Australian Pesticides and Veterinary Medicines Authority	Agricultural Chemicals and Veterinary Medicines	APVMA operates the national system that regulates all agricultural chemicals (including those produced or used on GE crops) and veterinary therapeutic products. Assessments consider human and environmental safety, product efficacy (including insecticide and herbicide resistance management), and trade issues relating to residues
<u>NICNAS</u> – National Industrial Chemicals Notification and Assessment Scheme	Industrial Chemicals	NICNAS provides a national notification and assessment scheme to protect the health of the public, workers and the environment from the harmful effects of industrial chemicals.
<u>Department of Agriculture and Water Resources</u>	Quarantine	The Department of Agriculture and Water Resources regulates the importation into Australia of all animal, plant and biological products that may pose a quarantine pest and/or disease risk. Import permit applications must indicate the presence of “GMOs” or GE material and the relevant authorization under the Gene Technology Act 2000.

The Act also establishes two [advisory committees](#) to advise the Gene Technology Regulator and the Legislative and Governance Forum on Gene Technology (LGFGT):

- [The Gene Technology Technical Advisory Committee](#) (GTTAC) – a group of highly qualified experts who provide scientific and technical advice on applications;
- [The Gene Technology Ethics and Community Consultative Committee](#) (GTECCC) – provides advice on ethical issues and on matters of general concern to the community in relation to GE materials and products.

Gene Technology Regulatory System

OGTR does not directly regulate the use of GE products in Australia. However, the use of GE products is regulated by other regulatory agencies in a number of situations as set out in the table above.

The biotech debate remains important in Australia. The federal government is very supportive of the technology, has committed considerable long-term funding to research and development, and approved GE cotton, carnations and canola varieties for general release. The state governments have also committed funds for research and development, but most were more cautious about the introduction of the technology and most Australian states initially put in place moratoria on new plantings of biotechnology crops. After state-level reviews in November 2007, NSW and Victoria lifted the moratoria on GE canola. In November 2008, WA lifted its ban to allow biotech cotton to be grown in

the Ord River region and in April 2009 announced that trials of GE canola would be allowed. In early 2010, WA passed legislation allowing the commercial production of GE canola. The outcome of a 2014 court case (see details further down in this report) and considerable pressure from key farm lobby groups saw the WA Government repeal the 2003 *GM Free Areas Bill* in October 2016. This means that GE crops can be legally grown in WA without the need for annual exemptions – i.e. the growing of GE canola in WA since 2010 has required the WA government to pass an exemption to the Bill each year.

Tasmania has just extended its moratoria until 2029 and the ACT has maintained their moratoria. NSW maintains a moratorium on the growing of GE food crops. The previous South Australian government passed legislation in 2017 that extended the moratorium until at least 2025, however, a change of State government in the March 2018 elections led to an [independent review](#) of the moratorium in South Australia. As a result of this review the [government of South Australia](#) has announced that, from January 1, 2020 GE crops can be grown in all areas of the state except Kangaroo Island.

Currently in Australia, almost 100 percent of the cotton planted is from biotech varieties, which were approved for release prior to the state moratoria. Although GE cotton varieties dominate the cotton industry in Australia, the state moratoria has slowed the commercialization and adoption of the technology for food crops.

The potential of agricultural biotechnologies to improve agricultural competitiveness was included in the Australian Government’s 2015 Agricultural Competitiveness White Paper. The government indicated that “agricultural biotechnologies, such as genetically modified crops, have the potential to transform agricultural productivity by delivering increased yields and lowering input costs. They can also improve environmental outcomes by reducing the need for inputs such as herbicides and water.”

b) APPROVALS: For many years biotech cotton, canola, and carnation varieties have been the only agricultural crops approved for commercial release in Australia. However, in June 2018, the Gene Technology Regulator (OGTR) approved the commercial release of GE safflower modified for high oleic acid composition. Commercial safflower production occurs mainly in NSW, Victoria and South Australia. The GE safflower has been developed for industrial applications.

The table in [Annex A](#) provides summary information about current Dealings for Intentional Release (DIRs) on the “GMO” Record (i.e. granted licenses for various uses including field trials). Full details of all applications (including those withdrawn and surrendered and those released for commercial use) can be found on the OGTR website at: <http://www.ogtr.gov.au/internet/ogtr/publishing.nsf/Content/ir-1>

c) STACKED EVENT APPROVALS: Stacked events must be licensed by the OGTR. For commercial release, this requirement can be met by either explicit listing of a particular stacked “GMO” in a license (through the license application process or license variation); or inclusion of the specific conditions in the licenses for the parent “GMOs” to encompass stacking between genetic modifications listed in separate licenses.

Full details of the OGTR policy on GE stacking can be found at:
<http://www.ogtr.gov.au/internet/ogtr/publishing.nsf/Content/gmstacking08-htm>.

d) FIELD TESTING: See above table for a list of products approved for field trials. A map of trial sites is available on the OGTR website at:

<http://www.ogtr.gov.au/internet/ogtr/publishing.nsf/Content/map>.

e) INNOVATIVE BIOTECHNOLOGIES: The *Gene Technology Act 2000* (section 10) contains a broad definition of “gene technology,” and a broad definition of “GMO.” The *Gene Technology Regulations 2001* (the Regulations) provide some exclusions to the definitions, some of which have not been changed since 2001. Under the current legislation, there are challenges in applying the current definitions to some new technologies, however, the Regulator must apply the legislation as it stands.

A technical review of the Gene Technology Regulations 2001 was concluded in June 2019 and is with the Legislative and Governance Forum on Gene Technology for approval of the necessary amendments to the Regulations. Details on the outcomes can be found on the [OGTR Website](#).

Food Standards Australia New Zealand (FSANZ) is also [reviewing](#) how the Food Standards Code applies to food derived from new breeding techniques (NBTs) that were not in use when [Standard 1.5.2](#) – Food produced using gene technology, was first developed nearly 20 years ago.

The review is considering the extent to which food derived from various NBTs should be captured for pre-market approval under Standard 1.5.2 and whether the definitions for “food produced using gene technology” and “gene technology” in [Standard 1.1.2–2](#) should be changed to improve clarity about which foods require pre-market approval.

A [preliminary report](#) was released in August 2018 and FSANZ aims to have a final report available later this year which will include recommendations on whether to prepare a proposal to amend the Code.

f) COEXISTENCE: Coexistence of biotech, conventional, and organic crops has occurred in Australia since biotech cotton varieties were commercially grown in 1996. As part of any license to grow a biotech crop, OGTR stipulates the conditions under which the crop can be grown to avoid unintended comingling with conventional or organic crops in the vicinity on a case-by-case basis. For license applications for environmental release of “GMOs,” the Regulator must consult on the risk assessment and risk management plan with States and Territories, other Australian Government agencies, relevant local councils, and the general public.

Segregation and coexistence, along with other marketing and economic considerations, are managed through state specific regulations and industry protocols.

A number of publications on coexistence are available on the Department of Agriculture website at: <http://www.agriculture.gov.au/ag-farm-food/biotechnology/reports>. The Agricultural Biotechnology Council of Australia also maintains a mini-website focused on providing information on coexistence - <http://coexistence.abca.com.au/>.

g) LABELING:

Labeling of Biotech Food

Food Standards Australia New Zealand (FSANZ) is the Australian Government agency responsible for approving GE food products for the Australian market. Mandatory labeling of GE foods, where introduced deoxyribonucleic acid (DNA) or protein is present in the final food, came into force in Australia on December 7, 2001. Regulations for labeling are contained in [Standard 1.5.2](#) of the [Food Standards Code](#).

Under the Standard, food or ingredients containing new genetic material or protein as a result of the genetic modification, or which have altered characteristics (e.g. changed nutritional values, compared to the conventional food), must be labeled as genetically modified. Some flavorings may also be derived from GE organisms, but labeling is only required if they are in a concentration of more than one percent. Food additives and processing aids do not need to be labeled unless the introduced genetic material is present in the final food.

Under the labeling standard, if the one percent threshold of GE ingredients is present, packaged foods must use the words “genetically modified” in conjunction with the name of the food or in association with the specific ingredient within the ingredient list. For unpackaged foods destined for retail sale (such as unpackaged fruit and vegetables, or unpackaged processed or semi-processed foods) the words “genetically modified” must be displayed in association with the food or in association with the GE ingredient within that food.

Refined oil from biotech cottonseed does not require a label because the oil contains no genetic material and the cottonseed oil is identical to conventional cottonseed oil.

Labeling of Biotech Feed Products

GE animal feed does not require special labeling in Australia. These products do, however, need to be approved by the OGTR for use in Australia and must also meet biosecurity import conditions.

The Department of Agriculture and the OGTR must approve GE whole grain commodities (including oilseeds) imported into Australia for animal feed (i.e. whole soybeans and corn). The Department of Agriculture provides quarantine inspection and certification for the arrival of imports to ensure the product is free of pest and disease and meets specific license conditions. The OGTR also assesses the product, issues a license to the organization importing the product, and may apply further conditions above those stipulated by the Department of Agriculture.

The OGTR considers any biosafety risks associated with the product and, if necessary, will apply special conditions, or may prohibit the use of the product as animal feed. For instance, after a GE product has undergone field trials, the organization conducting the trials may wish to use the unviable by-product (such as seed) as animal feed. Before the product is used in any way, the Gene Technology Regulator will consider any risks and, if necessary, will apply conditions or disallow the product to be used. [See OGTR Fact Sheet: Stockfeed and genetically modified crops](#).

Large amounts of biotech feed products are used in Australia's intensive livestock sector. A large proportion of Australia's soybean meal is imported, including from the United States. All cottonseed meal used in Australia is considered to be biotech as almost 100 percent of the cotton crop is derived from biotech varieties. Biotech and non-biotech cotton varieties are not typically segregated in Australia unless a specific market requires it.

h) MONITORING AND TESTING: To ensure that GE products comply with regulatory requirements, the [Regulatory Compliance](#) area of the OGTR undertakes monitoring, audits, inspections and investigations under the auspices of the Gene Technology Act 2000. Monitoring and compliance activities also comprise risk assessment and management, reviews of an organization's activities and reporting.

i) LOW LEVEL PRESENCE POLICY: Australia has endorsed the [International Statement on Low Level Presence](#) of GE.

In October 2005, national consensus was achieved in Australia regarding practical thresholds to deal with the issue of traces of GE canola in conventional canola consignments and variety trials. The Primary Industries Ministerial Council (PIMC), which comprises ministers from the Australian government and each state and territory, agreed on adventitious presence (AP) thresholds for the presence of GE canola in conventional grain and seed.

The PIMC meeting agreed on two thresholds:

- An AP threshold of 0.9 percent GE canola in canola grain. This is the threshold supported by the Australian Oilseeds Federation.
- A second threshold for AP of GE canola in seed was set at 0.5 percent for 2006 and 2007, to be reduced to 0.1 per cent thereafter. The Australian Seed Federation (ASF) established an AP threshold of 0.5 per cent GE seed in non-GE planting seed in 2003 following two years of research and consultation with the canola seed industry.

In 2005, the Australian government Biotechnology Ministerial Council endorsed a risk-based national [strategy](#) to manage the unintended presence of unapproved GE in imported seeds for sowing. The OGTR is responsible for implementing the strategy, which has six components (see table below) and employs a risk management approach with resources dedicated to the areas posing the highest likelihood of unintended presence.

Components of National Strategy for Unintended Presence of Unapproved “GMOs”

Component	Description
Risk profiling – identifying seed imports posing the highest likelihood of unintended presence	The OGTR has established a memorandum of understanding with Department of Agriculture to access data on imports. Data on imported seeds for sowing, together with information on overseas commercial production of “GMOs” and input from the Department of Environment, Water, Heritage and the Arts, and other relevant agencies was used to identify eight priority crops. Four additional crops that may pose a higher likelihood of unintended presence were subsequently identified.
Quality assurance/identity preservation	Industry uses quality assurance and identity preservation systems for seed quality purposes. The OGTR developed a program for auditing and testing industry quality assurance systems that industry has agreed and adopted.
Laboratory testing	The OGTR’s voluntary code of conduct refers to industry testing programs. Industry needs to be able to assure itself that it is managing the risk of importing unapproved seeds. Discussions between the OGTR and the National Measurement Institute about appropriate testing methodologies are ongoing.
Approvals/advance risk assessments for Australia’s regulatory agencies	The OGTR has prepared “GMO” incident response documents for 12 crops identified through risk profiling as having the highest likelihood of unintended presence in imports of seeds for sowing (canola, cotton, maize, potato, tomato, papaya, soybean, squash, alfalfa, grasses, rice and wheat). These documents will provide a basis for rapid risk assessment and management actions should an unintended presence of an unapproved “GMO” be detected.
Post market detection	The OGTR recognizes the legislative limitations of preventing unintended imports of unapproved “GMOs” and has worked cooperatively with industry to develop a voluntary code. The code aims to isolate risks as early as possible in the commercial seed supply chain. In 2007, the OGTR inspected a number of the larger seed breeding operations. This allowed the OGTR to build its knowledge base of the industry and the quality assurance systems used by the major players. These inspections focused on canola as the ASF had already developed “GM” testing protocols for this crop. In 2008, the OGTR and the Australian Seed Federation assessed the effectiveness of the first stage of reviews completed in 2007, noting that no issues of concern were identified for the five companies participating in the quality assurance reviews. The OGTR is continuing work with the Australian Seed Federation to expand the quality assurance review program as needed. These activities are supported by the standard OGTR practice of investigating information about potential and possible incidents.
Enforcement action	In the event of detection of unapproved “GMOs,” appropriate responses would be determined on a case-by-case risk management basis. The OGTR continues consultation with Australian Government agencies, relevant industry organizations and states and territories to develop an incident response plan.

Source: OGTR

j) ADDITIONAL REGULATORY REQUIREMENTS: Not applicable.

k) INTELLECTUAL PROPERTY RIGHTS (IPR): Intellectual property rights for plants are administered by [IP Australia](#) under the [Plant Breeder's Rights Act 1994](#).

l) CARTAGENA PROTOCOL RATIFICATION: Australia has not signed or ratified the Biosafety Protocol and the Australian government has no timetable for consideration of accession to the Protocol. This was due to concerns about how the Protocol will operate in practice (documentation requirements, and the liability and compliance arrangements are yet to be agreed), uncertainty about how parties will implement the Protocol, and whether they will do so in a way which respects all of their international obligations, and uncertainty about any individual country's capacity to influence decision-making. The Australian government considers that the Protocol is not needed for Australia to manage biotech imports as Australia already has a robust regulatory framework through the OGTR.

m) INTERNATIONAL TREATIES/FORUMS: Under section 27 of the *Gene Technology Act 2000*, the Gene Technology Regulator's functions include: monitoring international practice in relation to regulation of "GMOs;" maintaining links with international organizations that regulate "GMOs" in countries outside Australia; and promoting harmonization of risk assessments relating to "GMOs" and GE products by regulatory agencies. The OGTR have established a significant international presence.

Australia participates in multilateral efforts to promote the application of science-based, transparent and predictable regulatory approaches that foster innovation and ensure a safe and reliable global food supply, including the cultivation and use of agricultural products derived from innovative technologies. Since the Australian regulatory scheme began in 2001, the OGTR has been involved in multilateral forums and collaborations with counterpart agencies in other countries.

Australia is one of the supporting governments (along with Brazil, Canada, Argentina, Paraguay and the United States) of the "[Joint Statement on Innovative Agricultural Production Technologies, particularly Plant Biotechnologies](#);" a contracting party to the International Plant Protection Convention; has been a member of Codex since 1963; and participates in the OECD Working Group on Harmonization of Regulatory Oversight in Biotechnology.

n) RELATED ISSUES: The [Australian Centre for International Agricultural Research](#) (ACIAR) funds collaborative research projects including collaborative research projects involving biotechnology. [ACIAR](#) is an Australian government statutory authority within the Foreign Affairs portfolio and is Australia's government development agency that oversees international agricultural research. Their core business is brokering and funding research partnerships between Australian scientists and their counterparts in developing countries as an element of the Australian Government's aid policy. They work primarily in four regions: Papua New Guinea and Pacific Island countries; East Asia; South and West Asia; and Eastern and Southern Africa.

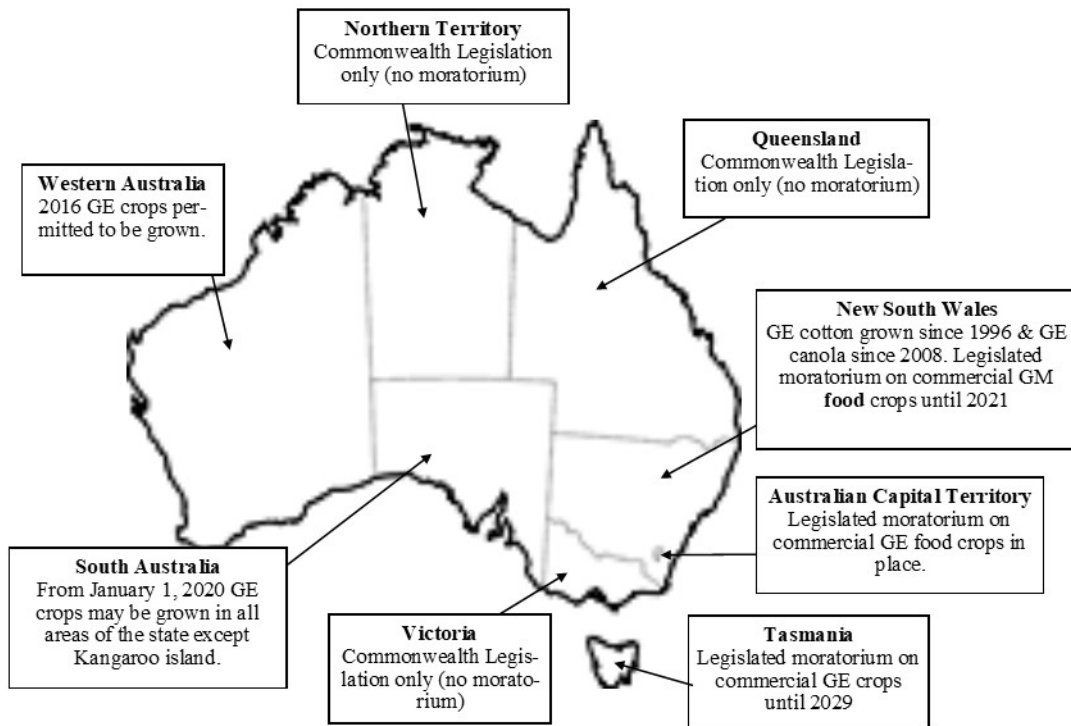

PART C: MARKETING

a) PUBLIC/PRIVATE OPINIONS: The OGTR commissions a report into community attitudes to gene technology. The latest survey was carried out in 2019 and the final report can be downloaded on the [OGTR website](#). The overall finding of the 2019 survey is that Australian attitudes to “GMOs,” have moved significantly towards neutral middle positions with the proportion of those less supportive of “GMOs” declining.

b) MARKET ACCEPTANCE: Australia has a substantial, risk assessment based regulatory framework for dealings with gene technology and GE organisms. The government is supportive of the technology for its agricultural producers and has been an ally of the United States with regard to the Cartagena Protocol on Biosafety. This comes despite anti-biotechnology activism in Australia that promoted stringent labeling requirements and encouraged moratoria on biotechnology plantings.

Major Australian commodity groups originally voiced concerns about introducing biotech canola and advocated for a ‘go-slow’ approach largely because of the potential impact biotech canola could have on their domestic and export businesses. In 2003 and 2004, several state governments (Victoria, NSW, South Australia, WA, Tasmania and the ACT), using their powers over commodity marketing, imposed moratoria on the commercial release of products of biotechnology (with the exception of the previously approved cotton and carnations). Most of the moratoria were reviewed in 2007, and the states of NSW and Victoria lifted their bans on commercial plantings of GE canola and the first commercial crops were grown in these two states in 2008. In November 2008, the Western Australian government lifted their moratoria to allow GE cotton to be grown in the Ord River area and in April 2009 they also announced that trials of GE canola would be allowed at 20 sites in that state. In October 2016, WA repealed the *2003 GM Free Areas Bill*, allowing approved GE crops to be grown freely in that state without the need for annual exemptions. South Australia extended its moratorium until 2025 in November 2017. However, a change of State government in the March 2018 elections, led to an [independent review](#) of the moratorium and in August 2019 the [government of South Australia](#) has announced that, from January 1, 2020 GE crops can be grown in all areas of the state except Kangaroo Island. Moratoria also remain in place in Tasmania and the ACT.

Australia State Government GE Positions

Currently in Australia almost 100 percent of the cotton planted is from biotech varieties, and there has been little controversy concerning its cultivation. Environmental benefits and the significant decline in pesticide and herbicide use for this crop have been widely reported. Biotech cottonseed does appear in the domestic market through the oil and meal, and this has not resulted in any major opposition.

CHAPTER 2: ANIMAL BIOTECHNOLOGY

PART D: PRODUCTION AND TRADE

a) PRODUCT DEVELOPMENT: Researchers are using gene technology to improve the efficiency of animal production in Australia. This research, carried out by universities, Cooperative Research Centers (CRCs), and the CSIRO, uses the natural genetic variation in livestock populations to selectively breed animals that produce more meat, milk and fiber. Genetic technologies are also used to develop new vaccines and treatments for preventing and diagnosing livestock diseases. Research which involves the genetic modification of animals to benefit animal and human health using new innovative biotechnologies such as the use of CRISPR/Cas9 genome editing techniques to produce organisms such as AI-resistant chickens and modify allergens in chicken eggs, is also being conducted.

The [Commonwealth Scientific and Industrial Research Organization](#) (CSIRO) is currently undertaking research on a range of other [techniques](#) in the areas of agriculture, biosecurity and environmental sciences. Examples include:

- [Marker-assisted breeding](#) – Projects include: protecting wine grapes from mildew; and, helping cattle breeders select for hornless cattle.
- [Chicken sex determination](#) – a new gene technology to differentiate between male and female chicks pre-hatch.

In Australia, cloning of livestock is currently limited to small numbers of breeding cattle, predicted to be less than 100 beef and dairy cattle and a few sheep within a confined research environment. The work is being carried out by public and private research institutions and universities.

Australian research involving gene technology and animals is regulated by the OGTR. In addition, GE and cloned animals are subject to state and territory government animal welfare legislation applicable to animals used for scientific purposes, in addition to the Australian code of practice for the care and use of animals for scientific purposes.

b) COMMERCIAL PRODUCTION: None for commercial use.

c) EXPORTS: None for commercial use.

d) IMPORTS: None for commercial use.

e) TRADE BARRIERS: Quarantine requirements are the main trade barrier to animal products entering Australia. These requirements would equally apply to any GE animal products. There are no additional biosecurity requirements for cloned animals or animal products.

PART E: POLICY

a) REGULATORY FRAMEWORK: Australian research involving gene technology and animals is regulated by the OGTR. Genetically engineered and cloned animals are also subject to state and territory government animal welfare legislation applicable to animals used for scientific purposes, as well as the [Guidelines to promote the wellbeing of animals used for scientific purposes](#) and [Genetically modified and cloned animals for scientific purposes](#). Genetically engineered animals are considered ‘Notifiable Low Risk Dealings’ (NLRDs) by the OGTR – i.e. “dealings with GMOs that have been assessed as posing low risk to the health and safety of people and the environment provided certain risk management conditions are met.” A full list of NLRDs, including the institutions carrying out the research, is available on the OGTR website at: <http://www.ogtr.gov.au/internet/ogtr/publishing.nsf/Content/nlrdrec-1>.

The Department of Agriculture covers animal health (biosecurity) issues in their import risk assessments (IRAs). Cloned animals or products from cloned animals are not considered to be an animal health or biosecurity risks and have not been assessed as a hazard in the IRAs. There are no biosecurity restrictions in relation to the import of embryos derived from cattle, sheep or goats. The same applies for the import of products derived from cloned animals. They are subject to the same quarantine regulations as non-cloned products.

Food from cloned animals is not regulated in the same way as food from “GMOs.” FSANZ considers that food products from [cloned animals](#) and their offspring are as safe as food products from conventionally bred animals and does not require any additional regulation such as they have for food derived from GE crops.

b) APPROVALS

The table in [Annex B](#) provides summary information on current DIRs on the “GMO” Record (i.e. granted licenses for various uses including field trials). Full details of all applications (including those withdrawn and surrendered and those released for commercial use) can be found on the OGTR website at: <http://www.ogtr.gov.au/internet/ogtr/publishing.nsf/Content/ir-1>.

c) INNOVATIVE BIOTECHNOLOGIES: See Section II, Part B (e) above.

d) LABELING AND TRACEABILITY: There are currently a small number (30-40) cloned cattle in Australia being used for breeding purposes. Food from cloned animals is not currently entering the food chain but food from their offspring probably is. There is a voluntary agreement in place between Australian researchers and industry on the placing of food from cloned animals into the food chain. Food from cloned animals or their offspring does not require pre-market approval in Australia and there are no special labeling requirements. See [FSANZ website](#) for details.

e) INTELLECTUAL PROPERTY RIGHTS (IPR): Intellectual Property Rights in Australia are administered by [IP Australia](#).

f) INTERNATIONAL TREATIES/FORUMS: Australia is an active member of the OIE. Australia’s Chief Veterinary Officer (CVO) is the current elected President of the OIE World Assembly of Delegates. The office of the CVO coordinates Australia’s OIE work, drawing on expertise of other

Australian government departments and agencies, industry bodies and other experts.

f) **RELATED ISSUES:** N/A

PART F: MARKETING

a) **PUBLIC/PRIVATE OPINIONS:** No products from GE or cloned animals are currently in the Australian food chain, thus, there does not seem to be any opinion pieces appearing in the Australian media either for or against the technology. The information contained in Part C above indicates that public attitudes towards biotechnology, which in general are favorable but those attitudes have changed over a number of years to become more accepting. Scientists from CSIRO and other research institutions have collaborated through the OECD on the barriers to the uptake of “GM” animals and how to determine a pathway to removing those barriers.

b) **MARKET ACCEPTANCE:** No specific market acceptance research has been conducted on the acceptance of food from cloned animals.

ANNEX A

The table below provides summary information about current Dealings for Intentional Release (DIRs) on the “GMO” Record (i.e. granted licenses for various uses including field trials) for **plant products**.

Crop	Applicant	Modified Trait	License Purpose
Banana (<i>Musa</i> spp.)	Queensland University of Technology	Disease resistance, Selectable marker – antibiotic	Limited and controlled release of banana genetically modified for disease resistance
Bread wheat (<i>Triticum aestivum</i>) and durum wheat (<i>Triticum turgidum</i> subsp. <i>durum</i>)	CSIRO	Disease resistance, Selectable markers	Limited and controlled release of bread wheat and durum wheat genetically modified for enhanced rust disease resistance
Buffalo grass (<i>Stenotaphrum secundatum</i> (Walter) Kuntze)	Royal Melbourne Institute of Technology University	Herbicide tolerance, Plant development-altered plant architecture	Limited and controlled release of buffalo grass genetically modified for herbicide tolerance and dwarf phenotype
Canola (<i>Brassica napus</i> L.)	Monsanto Australia Limited	Herbicide tolerance	Limited and controlled release of canola genetically modified for herbicide tolerance
Canola (<i>Brassica napus</i> L.)	Nuseed Pty Ltd	Composition - food (human nutrition), Composition - animal nutrition, Selectable marker - herbicide, Selectable marker - antibiotic, Herbicide tolerance	Limited and controlled release of canola genetically modified for altered oil content and herbicide tolerance
Canola (<i>Brassica napus</i> L.)	Nuseed Pty Ltd	Composition - food (human nutrition), Composition - animal nutrition, Selectable marker - herbicide	Commercial release of canola genetically modified for omega-3 oil content (DHA canola)
Canola (<i>Brassica napus</i> L.)	Pioneer Hi-Bred Australia Pty Ltd	Herbicide tolerance	Commercial release of canola genetically modified for herbicide tolerance

Crop	Applicant	Modified Trait	License Purpose
Canola (<i>Brassica napus</i> L.)	BASF Australia Ltd	Herbicide tolerance, Hybrid breeding system	Commercial release of canola genetically modified for dual herbicide tolerance and a hybrid breeding system
Canola (<i>Brassica napus</i> L.)	Monsanto Australia Ltd	Herbicide tolerance	Commercial release of canola genetically modified for herbicide tolerance
Canola (<i>Brassica napus</i> L.)	Nuseed Pty Ltd	Composition - food (human nutrition), Composition - animal nutrition, Selectable marker	Limited and controlled release of canola genetically modified for altered oil content
Canola (<i>Brassica napus</i> L.)	BASF Australia Ltd	Herbicide tolerance/Hybrid breeding system	Commercial release of canola genetically modified for herbicide tolerance and a hybrid breeding system
Canola (<i>Brassica napus</i> L.)	BASF Australia Ltd	Herbicide tolerance, Hybrid breeding system	Commercial release of canola genetically modified for herbicide tolerance and a hybrid breeding system for use in the Australian cropping system
Canola (<i>Brassica napus</i> L.)	Monsanto Australia Ltd	herbicide tolerance	General release of Roundup Ready® canola (<i>Brassica napus</i>) in Australia
Carnation (<i>Dianthus caryophyllus</i> L.)	International Flower Developments Pty Ltd	Modified colour , Selectable marker – herbicide	Commercial import and distribution of genetically modified carnation cut-flowers with altered flower color
Chickpea (<i>Cicer arietinum</i> L.)	Queensland University of Technology	Environmental stress tolerance – drought; Selectable marker – antibiotic	Limited and controlled release of chickpea genetically modified for drought and other environmental stress tolerance

Crop	Applicant	Modified Trait	License Purpose
Cotton (<i>Gossypium barbadense</i> L.)	Monsanto Australia Ltd	Herbicide tolerance	Commercial release of herbicide tolerant (Roundup Ready Flex®MON88913) pima cotton in Australia
Cotton (<i>Gossypium hirsutum</i> L.)	Syngenta Australia Pty Ltd	Insect resistance	Commercial release of cotton genetically modified for insect resistance (COT102)
Cotton (<i>Gossypium hirsutum</i> L.)	Monsanto Australia Limited	Insect resistance and herbicide tolerance	Limited and controlled release of cotton genetically modified for insect resistance and herbicide tolerance
Cotton (<i>Gossypium hirsutum</i> L.)	Monsanto Australia Limited	Insect resistance and herbicide tolerance	Commercial release of cotton genetically modified for insect resistance and herbicide tolerance (Bollgard® 3 XtendFlex™ and XtendFlex™ cotton)
Cotton (<i>Gossypium hirsutum</i> L.)	BASF Australia Ltd	Insect resistance and herbicide tolerance	Commercial release of cotton genetically modified for insect resistance and herbicide tolerance (GlyTol® (BCS-GH002-5) and GlyTol TwinLink Plus® (BCS-GH002-5 x BCS-GH004-7 x BCS-GH005-8 x SYN-IR102-7))
Cotton (<i>Gossypium hirsutum</i> L.)	CSIRO	Product quality – non-food, Selectable marker – antibiotic	Limited and controlled release of cotton genetically modified for enhanced fibre quality
Cotton (<i>Gossypium hirsutum</i> L.)	Monsanto Australia Ltd	Herbicide tolerance, Insect resistance, Selectable marker - antibiotic, Reporter gene expression	Commercial release of GM insect resistant and herbicide tolerant (COT102 x MON-15985 [Bollgard®III] and COT102 x MON-15985 x MON 88913 [Bollgard®III x Roundup Ready Flex®]) cotton

Crop	Applicant	Modified Trait	License Purpose
Cotton (<i>Gossypium hirsutum</i> L.)	CSIRO	Yield, Selectable marker – antibiotic	Limited and controlled release of cotton genetically modified for enhanced fibre yield
Cotton (<i>Gossypium hirsutum</i> L.)	Dow AgroSciences Australia Pty Ltd	Insect resistance, Selectable marker - herbicide	Commercial release of cotton genetically modified for insect resistance (WideStrike™ Insect Protection Cotton)
Cotton (<i>Gossypium hirsutum</i> L.)	Monsanto Australia Ltd	Herbicide tolerance, Insect resistance, Selectable marker - antibiotic, Reporter gene expression	Commercial release of GM herbicide tolerant and/or insect resistant cotton lines north of latitude 22° South
Cotton (<i>Gossypium hirsutum</i> L.)	BASF Australia Ltd	Herbicide tolerance	Commercial release of herbicide tolerant Liberty Link® Cotton
Indian mustard (<i>Brassica juncea</i> (L.) Czern. & Coss.)	Nuseed Pty Ltd	Composition - food (human nutrition), Composition - animal nutrition, Selectable marker	Limited and controlled release of Indian mustard (<i>Juncea canola</i>) genetically modified for altered oil content
Perennial ryegrass (<i>Lolium perenne</i> L.)	Department of Economic Development, Jobs, Transport and Resources	Composition – animal nutrition, Yield, Selectable marker – antibiotic resistance	Limited and controlled release of perennial ryegrass genetically modified for fructan biosynthesis
Safflower (<i>Carthamus tinctorius</i> L.)	Go Resources Pty Ltd	Composition – non-food (processing), Selectable marker – antibiotic	Commercial release of safflower genetically modified for high oleic acid composition
Sorghum (<i>Sorghum bicolor</i>)	University of Queensland	Composition - animal nutrition, Yield, Selectable marker - antibiotic	Limited and controlled release of sorghum genetically modified for grain quality traits
Sugarcane (<i>Saccharum</i> spp.)	Sugar Research Australia Ltd	Herbicide tolerance	Limited and controlled release of sugarcane genetically modified for herbicide tolerance

Crop	Applicant	Modified Trait	License Purpose
Wheat (<i>Triticum aestivum</i> L.)	The University of Melbourne	Composition – food (human nutrition), Selectable marker – antibiotic, Selectable marker – herbicide	Limited and controlled release of wheat genetically modified for altered iron uptake, transport and bioavailability
Wheat (<i>Triticum aestivum</i> L.)	CSIRO	Disease resistance, drought tolerance, Composition - food (processing), Composition - food (human nutrition)	Limited and controlled release of wheat genetically modified for disease resistance, drought tolerance, altered oil content and altered grain composition
Wheat (<i>Triticum aestivum</i> L.) and Barley (<i>Hordeum vulgare</i> L.)	The University of Adelaide	Abiotic stress tolerance; enhanced yield; selectable marker	Limited and controlled release of wheat and barley genetically modified for abiotic stress tolerance and yield improvement
Wheat and barley (<i>Triticum aestivum</i> L. and <i>Hordeum vulgare</i> L.)	The University of Adelaide	Abiotic stress tolerance, Yield, Composition – food (human nutrition), Selectable marker – antibiotic	Limited and controlled release of wheat and barley genetically modified for abiotic stress tolerance or micronutrient uptake

ANNEX B

The table below provides summary information about current DIRs on the “GMO” Record (i.e. granted licenses for various uses including field trials) for **animals and viruses**.

Organism	Applicant	Modified Trait	License Purpose
Respiratory syncytial virus	Clinical Network Services Pty Ltd	Human therapeutic - attenuation	A genetically modified respiratory syncytial virus (RSV) vaccine for use in clinical trials
Insect-specific flaviviruses	The University of Queensland	Vaccine – altered antigen expression	Limited and controlled release of genetically modified insect-specific viruses as vaccines against Kunjin virus infection in farmed crocodiles
Infectious laryngotracheitis virus (<i>Gallid herpesvirus 1</i>).	Bioproperties Pty Ltd	Vaccine - attenuation	Limited and controlled release of a GM vaccine for chickens, Vaxsafe® ILT
Yellow fever virus (YF17D)	Sanofi-Aventis Australia Pty Ltd	Vaccine - altered antigen expression	Commercial supply of Dengvaxia, an attenuated “GM” dengue vaccine
Influenza virus	Clinical Network Services (CNS) Pty Ltd	Human therapeutic - attenuation	Clinical trial of live attenuated genetically modified influenza vaccines
Vaccinia virus	Clinical Network Services (CNS) Pty Ltd	Human therapeutic-attenuation, enhanced immune response. Reporter gene expression.	Clinical trial of a genetically modified virus for treatment of liver cancer and kidney cancer
Influenza virus	AstraZeneca Pty Ltd	Vaccine - attenuation	Commercial supply of attenuated “GM” influenza vaccines
Herpes simplex virus-1	Amgen Australia Pty Ltd	Therapeutic – attenuation, therapeutic – enhanced immune response	Commercial supply of a tumour-selective genetically modified virus for cancer therapy
Cholera bacterium (Vibrio cholerae)	PaxVax Australia Pty Ltd	Vaccine – attenuation, Selectable marker – other	Clinical trial of a genetically modified vaccine against Cholera

Organism	Applicant	Modified Trait	License Purpose
<i>Escherichia coli</i>	Zoetis Australia Research & Manufacturing Pty Ltd	Vaccine - attenuation	Commercial release of genetically modified vaccine to protect chickens against pathogenic <i>Escherichia coli</i>
Yellow fever virus (YF 17D)	Sanofi-Aventis Australia Pty Ltd	Vaccine - attenuation, Vaccine - antigen expression	Commercial release of a genetically modified live viral vaccine to protect against Japanese encephalitis (IMOJEV) TM
