Report Name: Continuing Good Prospects for US Organic Exports to the EU

Country: European Union

Post: Vienna

Report Category: Special Certification - Organic/Kosher/Halal, Agricultural Situation

Prepared By: Roswitha Krautgartner, Sophie Bolla

Approved By: Kirsten Luxbacher

Report Highlights:

The upward trend on the organic food market in the European Union (EU) continues. EU Organic sales are steadily rising. The COVID-19 pandemic seems to be an additional driver in further boosting organic sales in 2020. There are continuing good prospects for U.S. organic product exports to the EU. USDA endorsed EU trade shows like BioFach, the world’s largest organic trade fair, provide an excellent gateway for U.S. companies to establish contact with business partners. This report provides an overview of the EU market, policy, and trade related to U.S. organic exports.
General Information:
Disclaimer: This report presents the views of the authors and does not reflect the official views of the U.S. Department of Agriculture (USDA). The data are not official USDA data.

Unless otherwise noted, “EU” in this report refers to the EU-27 + UK. Please note, that the United Kingdom (UK) left the EU Customs Union on January 1, 2021.

This report was a group effort of the following FAS analysts:

Lisa Allen, USEU FAS Brussels covering EU policy
Ornella Bettini FAS Rome covering Italy
Sophie Bolla USEU/FAS Brussels covering EU policy and covering Belgium and Luxembourg, author of “Organic Policy in the EU” chapter of this report
Mila Boshanakova FAS Sofia covering Bulgaria
Monica Dobrescu FAS Bucharest covering Romania
Dimosthenis Faniadis FAS/Rome covering Greece
Golya Gellert FAS Budapest covering Hungary
Martina Hlavackova FAS Prague covering Czech Republic and Slovakia
Laurent Journo FAS Paris covering France
Mira Kobuszynska FAS Warsaw covering Poland, Latvia, Estonia and Lithuania
Roswitha Krautgartner FAS Berlin covering Germany
Arantxa Medina FAS Madrid covering Spain and Portugal
Andreja Misir FAS Zagreb covering Croatia
Marcel Pinckaers FAS The Hague covering the Netherlands, Denmark, Sweden, and Finland.
Jennifer Wilson FAS London covering the U.K. and Ireland

Summary
On June 1, 2012, the United States (U.S.) - European Union (EU) organic equivalency arrangement went into effect. As a result, organic food and agricultural products certified in the United States or EU are able to be labeled and sold as organic in either market, streamlining trade between the world’s two largest organic markets. In 2019, the EU market for organic products increased by 14 percent reaching $51.8 billion. Germany and France remain the largest organic markets in the EU, representing more than half of its organic market. The growing demand for organics in the EU, combined with the equivalency arrangement creates trade opportunities for U.S. exporters. The EU offers market potential for U.S. organic sweet potatoes, fresh produce, dried fruit and nuts, specialty grains, and processed products. U.S. exporters will compete primarily on quality and price, but there are also good opportunities for innovative and premium products.
In 2020, the COVID-19 pandemic seems to be an important driver further boosting organic sales. Consumers changed their food purchasing and consumption habits during periods of “lockdown” when restaurants were closed, and home cooking became the norm. In order to take better care of themselves, when purchasing food at retail locations, consumers tended to purchase foods they viewed as good for their health. Surveys show that they also increasingly took into account sustainability into their purchasing decisions. These factors positioned organic foods well during this time.

Without question, U.S. companies are profiting from the long-term growth of the EU organic market. Unfortunately, official trade data covers just a fraction of traded organic products as organic-specific Harmonized System (HS) codes are limited and exist for only specific commodities. Existing HS codes primarily cover organic fresh products like milk, fruits, and vegetables, but do not currently exist for most processed products or organic nuts. Total tracked U.S. organic exports to the EU reached record levels in 2018. The value of U.S. exports of tracked organic products in 2019 was slightly above 2017 exports. Exports in 2020 are forecast to further increase. However, the actual total of U.S. exports of organic products to the EU is likely much higher.

BioFach, the world’s largest organic trade show, offers a unique opportunity for both new-to-market players and established companies to meet new contacts, gather trade leads, and learn about the global organic market. BioFach 2021 will be held virtually in Nuremburg Germany, February 17-19, 2021 due to the COVID-19 pandemic. BioFach is a USDA-endorsed trade show.

Section VI. Market Development
Section VII. Post Contact and Further Information
Annex Current list of U.S. organic export HS codes

Section I. The EU Organic Agricultural Market and Production

The United States and the EU are the world’s first and second largest organic markets. Both have shown dynamic growth rates the last couple of years with the United States overtaking the EU as the leading global organic food market in 2012. According to the Organic Trade Association, the United States hit record sales of $55.1 billion in 2019. FAS offices in the EU estimate that the EU market totaled $51.8 billion in 2019, with a strong 14 percent increase compared to the previous year. The EU organic market showed almost the same growth as the U.S. market. Within the last 10 years, the organic food market in the EU has more than doubled.
All leading organic markets in the EU demonstrated growth in 2019. The largest markets continued to be Germany and France, representing more than half of the total EU organic market.
An important driver behind the growing organic market in the EU is the predominance of large full-service supermarket chains. These chains place organic products on the shelves next to conventional products, resulting in a greater availability of organic products for a larger audience. Specialty organic stores also play an important role as they become more professional, open more storefronts and offer a wider assortment of organic products than regular full-service supermarkets. The distribution of organic products differs considerably between member states. In Denmark, Austria, and the UK, full-service supermarkets dominate the distribution of organic products. In Italy, the Netherlands, France, Belgium, and Germany, the share of full-service supermarkets and organic specialty shops is more evenly divided.

In 2020, the COVID-19 pandemic seems to be an important driver further boosting organic sales. Consumers changed their food purchasing and consumption habits during periods of “lockdown” when restaurants were closed, and home cooking became the norm. In order to take better care of themselves, when purchasing food at retail locations, consumers tended to purchase foods they viewed as good for their health. Surveys show that they also increasingly took into account sustainability into their purchasing decisions. These factors positioned organic foods well during this time.

In 2019, the countries with the highest sales per person, per year of organic food and drinks (totaling $100 or more) were Denmark, Sweden, Austria, Luxembourg, France, Germany, and the Netherlands. At the same time, there were a dozen members states, mainly in Eastern Europe, with sales of less than $10 per person.

![Highest Organic Food Sales per Person in the EU](chart)

Source: USDA/FAS Posts in EU
Consumers of organic products in Europe can be roughly divided into two groups. The first group, the so-called ‘regular buyers,’ is a rather small, committed group that has been buying organic products for decades. Although this group is small, they are responsible for almost half of the EU’s organic sales. Regular buyers tend to buy at organic specialty shops or farmers’ markets and price is not an important purchasing decision factor.

The second and much larger group represents a different demographic. Double-income households with no children, older consumers (aged 50-75), and new-trend seekers fall into this group. They buy organic products for various reasons, including healthy lifestyle, food safety concerns, animal welfare, sustainability, quality and perceived taste, as well as innovative packaging. This so-called ‘light buyers’ group buy organic products at full-service supermarkets and also in specialty shops. Due to its size and diversity, it is this group that the organic industry should focus on to generate further growth in the near future.

The growing demand for organic products has led to an increase in organic production. Organic agricultural land in the EU has more than doubled in the past decade. The largest areas are in Spain, France, Italy, and Germany and together account for more than half of the EU organic area. Latest estimates show that in 2019, almost 14 million hectares or 34 million acres were under organic agricultural management.

![Organic Acreage in the EU](image)

**Organic Acreage in the EU**
in %, total of 13.8 million hectare, in 2019

- Spain 16%
- France 16%
- Germany 10%
- Italy 14%
- Austria 5%
- Sweden 4%
- Other 35%

Source: USDA/FAS Posts in EU
About 45 percent of organic agricultural land in the EU is used for permanent organic grassland, with Spain, Germany, and the UK comprising the largest areas. Another 40 percent of the organic area is used for arable crops. The largest arable crop groups are green fodder and cereal production with the largest areas found in Italy, Spain, and France. Finally, over 10 percent is being used to grow permanent crops, of which two-thirds is in Spain, Italy, and France. Most of this land is used for the production of olives, grapes, and nuts. The proportion of agricultural land farmed organically differs widely between EU Member States. The highest share of area dedicated to organic farming is reported in Austria, followed by Sweden, Italy, Finland, Czech Republic, Denmark, and Slovakia.

Section II. Exports of U.S. Organic Food

In 2019, global U.S. organic food exports were officially valued at $683 million. Canada and Mexico are still by far the largest markets followed by Japan, South Korea, Taiwan, and the EU. Please note that tracking of organic food exports only began in 2011 and the current “Harmonized System” (HS) codes of organic products cover only a fraction of total organic trade (in the following text referred to as “selected U.S. organic exports”). Existing HS codes primarily cover organic fresh products like milk, fruits, and vegetables, but do not currently exist for most processed products or organic nuts. Actual U.S. exports of organic products globally are estimated to be much higher.

The source of the following trade data is the U.S. Census Bureau Trade Data retrieved from USDA’s Global Agricultural Trade System Online (GATS). Please see the Annex for further information on the HS tariff codes for organic products.

Select U.S. Organic Exports to EU higher in 2020 compared to 2019
Select U.S. organic exports to the EU in 2020 are expected to surpass 2019 values but will not reach the record high of 2018. This is because in 2018, low domestic supply in the EU for some products supported increased exports to the EU.

---

1The Harmonized Commodity Description and Coding System, also known as the Harmonized System (HS) is a standardized international system to classify traded products.
In the first eleven months of 2020, the top U.S. organic products exported to the EU were organic vinegar, fresh apples, asparagus, berries, coffee, carrots, lemons, pears, strawberries, and tomato sauce. Organic vinegar and organic apples showed significant increases in export value compared to 2019. The United States’ top organic product exports change every year. This signifies a fluctuation of the price and supply situation in the United States as well as a fluctuating demand in the EU. In general, this is also more characteristic for the fresh food market than for processed food. Good opportunities exist for fresh produce during the European winter, when there is only limited and expensive production in green houses.
United Kingdom remains most important importer

As of January 2021, the exited the European Customs Union. However, this report still covers the EU27+UK. Until leaving the EU Customs Union, the UK was the most important EU importer of U.S. organic fresh produce. By November of 2020, some 62 percent (by value) of all U.S. selected organic exports destined for the EU went to the UK. This picture is expected to change significantly in 2021. Other important EU import countries for select U.S. products are the Netherlands, Germany, Belgium, Poland, and Spain. These countries together account for some 96 percent of U.S. organic imports by the EU from January through November 2020. Major EU importers act as distributors and transship organic products to other EU Member States. As with many other agricultural issues, the question of Brexit’s impact on this trade and transshipment is far from clear—particularly because the UK used to be the biggest importer.

Section III. The EU-U.S. Organic Equivalence Cooperation Arrangement

The United States has an organic equivalence arrangement with the EU. This means that as long as the terms of the arrangement are met, organic operations certified to the USDA organic or EU organic standards may be labeled and sold as organic in both markets. Since 2012, this partnership has streamlined trade between the two largest organic producers in the world. It provides organic farmers and businesses access to a $107 billion and growing combined market.

All organic products traded under the partnership must be shipped with an organic import certificate. This document lists the production location, identifies the organization that certified the product as organic, verifies that prohibited substances and methods were not used, certifies that the terms of the partnership were met, and allows traded products to be tracked.

Both parties are committed to ensuring that all traded organic products meet the terms of the partnership, retaining their organic integrity from farm to market. The European Commission's Directorate General for Agriculture and Rural Development and the USDA National Organic Program (NOP) - which oversees all U.S. organic products - both have key oversight roles. This arrangement only covers products exported from and certified in the United States or the EU.

Please use the following link for more information on the arrangement including requirements, certifying agents, and the import certificate: https://www.ams.usda.gov/services/organic-certification/international-trade/european-union
Section IV. Organic Policy in the EU

The current legal framework governing organics in the EU is Regulation (EC) 834/2007. This Regulation outlines the objectives and principles of organic agriculture in the EU, fixes general production rules, and describes the EU’s organic production standards, control system and labeling requirements. In spring 2018, the EU adopted the text of the new EU Regulation on Organic Production and Labeling of Organic Products (Regulation (EU) 2018/848). This new Organics Regulation was supposed to enter into force on January 1, 2021. However, due to the current difficulties faced by the sector because of the COVID-19 pandemic, the EU decided to postpone the entry into force of the new Regulation to January 1, 2022.

Regulatory requirements under Regulation 2018/848

The new Organic Regulation will introduce regulatory changes both for the production of organic products in the EU and for imports of organics.

- Scope
  The scope of the organic rules was enlarged to cover a wider list of products than the previous legislation. New products include salt, cork, beeswax, maté, vine leaves, essential oils, and palm hearts. The full list can be found in Annex I of the Regulation. It also lists additional production rules for livestock farming for deer, rabbits, and poultry.

- Labeling
  There are no significant changes to the labeling rules with the 2018 Regulation. The term “organic” and all its derivatives or diminutives such as “bio” and “eco” may be used only to label products that comply with EU organic production rules and if at least 95 percent of the ingredients of agricultural origin are organic. For products containing less than 95 percent organic ingredients, the term “organic” may be used only to indicate individual organic ingredients in the list of ingredients. When reference is made to the organic production method in the ingredients list, the total percentage of organic ingredients must be indicated. Products containing genetically modified organisms (GMOs) or produced with GMOs cannot be labeled as organic.

The use of the EU organic logo is mandatory on all pre-packaged organic products produced in the EU. Organic products imported from non-EU countries may carry the EU organic logo if they comply with the EU production rules. When the EU organic logo appears on the label, the indication of the place of farming is required. This indication may be classified as ‘non-EU Agriculture,’ where the agricultural raw material has been farmed outside of the EU. However, ‘non-EU’ may be replaced or supplemented by the name of a country, or by the name of a region if all of the agricultural raw materials of which the product is composed have been farmed in that region.
**Food production**

The 2018 Organic Regulation will introduce stricter rules for the use of natural flavoring in organic food preparations. Currently, all-natural flavorings are allowed. Under Regulation 2018/848, only natural flavorings originating from the mentioned ingredients can be used in organic processing. For example, only ‘natural strawberry flavoring’ will be allowed, which means that the flavoring must be at least 95 percent obtained from strawberries. In this case, strawberry extracts will be allowed. Under the new Organic Regulation, flavorings will be regarded as agricultural ingredients. This means that the maximum permissible amount of conventional flavorings in an organic product, together with all other non-organic ingredients, shall not exceed 5 percent of the total agricultural ingredients.

Regulation 2018/848 will also limit the use of additives and processing aids to produce food and feed. Only certain products and substances are authorized for use in the production of processed organic food and feed, alongside yeast. The list of products and substances that may be used in the production of organic processed products is listed in Part IV of Annex II of the Regulation.

**Specific rules for imported organic products**

The EU and the United States signed the EU-U.S. Organic Equivalency Arrangement in 2012. Under the arrangement, the EU recognizes the USDA NOP as equivalent to the EU Organic Program (under applicable EU regulations) and allows U.S. organic products to be marketed as “organic” in the EU using the EU organic logo. The arrangement is limited to organic products of U.S. origin, either produced within the United States or where the final processing or packaging occurs within the United States. More information can be found here: [https://www.usda-eu.org/trade-with-the-eu/trade-agreements/us-eu-organic-arrangement/](https://www.usda-eu.org/trade-with-the-eu/trade-agreements/us-eu-organic-arrangement/)

With the new Organic Regulation, the EU will require trade agreements in place of the current equivalence arrangements. With these EU regulatory changes, the U.S.-EU equivalence arrangement will expire on January 1, 2027, five years after the entry into force of the new regulation. To avoid trade disruptions, all non-EU countries, including the United States, that are currently recognized as equivalent may renegotiate the terms and sign a trade agreement on organic products with the EU. Trade agreements will aim to recognize that the non-EU country has a “system of production meeting the same objectives and principles by applying rules which ensure the same level of assurance of conformity as those of the Union.” As of January 2021, Chile is the only country that has signed an Agreement with the EU on trade in organic products.
Section V. Trade Opportunities for U.S. exporters on the EU organic market

The growing market for organic products in the EU combined with the U.S.-EU arrangement has created more opportunities for U.S. exporters. Generally speaking, U.S. commodities and ingredients will compete on price and quality, however, finding niches for innovative and premium packaged products is also possible. There is a strong preference for local and regional foods over imported food in the EU. As a result, commodities where there is no local/regional alternative may be more successful. There are opportunities for U.S. exporters in the following markets:

- The market for sweet potatoes is growing. EU demand for potato varieties is high. The United States is the best year-round supplier of sweet potatoes at competitive prices.
- There is a market for fresh vegetables like carrots, onions, broccoli, and lettuce, particularly in the UK and the Netherlands.
- Processed vegetables are in demand in the Nordic region due to limited local availability.
- Pulses, especially beans and lentils, are increasingly becoming popular in north-western Europe because of a growing demand for healthy food products. Local supply is not meeting the demand.
- In countries with no local availability, there is demand for a great variety of fresh fruit from the United States. There is seasonal (October through March) demand for apples and pears in north-western and central Europe. Demand in the same region is also strong for U.S. citrus (grapefruit and tangelos). There is year-round growing demand for fresh, dried, sweetened cranberries. There is also growing demand for other fruits such as grapes, strawberries, and cherries.
- Driven by the healthy snack and baking industry, there is a strong growing demand for tree nuts from the United States, especially for hazelnuts, almonds, walnuts, and pistachios.
- Growing consumer awareness and therefore demand for specialty grains is also increasing. High interest from the baking industry adds to this demand.

Demand for U.S. organic processed products is especially high in the UK, Germany, and the Nordic region. Consumers are increasingly looking for healthy snacks (cereal/nut bars), organic confectionary products, maple sugar and syrup, and organic beverages.

Single Country Reports
There are country reports on the organic market in EU Member States. They can be downloaded from the FAS website and contain country specific market information under the following link:

https://fas-europe.org/?page_id=551&limit=&catid=0&ftags=organic
VI. Market Development

The Organic Trade Association (OTA) has a wealth of information and experience in helping U.S. companies in their endeavors expanding business overseas. Information about the OTA and how they can help the U.S. organic industry can be found at https://ota.com/.

In addition to the OTA, there are various other cooperators that can be of assistance in promoting your organic commodities in the EU. An overview of U.S. commodity cooperators can be found at https://apps.fas.usda.gov/pcd/PartnersSearch.aspx. Note that not all U.S. cooperators have programs for the EU.

Trade shows are excellent venues for U.S. exporters to make contact with potential business partners, to conduct product introductions and to gauge buyers’ interest. BioFach is the largest international trade show for organic products in the world. BioFach is USDA-endorsed. More information about BioFach can be found at https://www.biofach.de/en.

Fruit Logistica (https://www.fruitlogistica.com/) is a regional (European) trade show that also attracts buyers of organic fresh produce, nuts, and dried fruits. This show is also USDA-endorsed and has an excellent U.S. pavilion.

U.S. exporters of organic food ingredients should consider exhibiting or visiting the Health Ingredients (https://www.figlobal.com/hieurope), Food Ingredients (https://www.figlobal.com/fieurope) or Vitafoods (https://www.vitafoods.eu.com/) trade shows. These shows attract many in the food processing industry.

There are also numerous regional organic shows throughout Europe. For example, Bio Beurs is the leading organic event in the Netherlands where mostly Dutch suppliers exhibit their latest food products and technologies. If you are interested in one of the regional shows, please contact the responsible FAS office for more information. (www.fas-europe.org/countries/)

Finally, trade shows like ANUGA or SIAL attract mainly buyers of specialty and retail-ready products and are therefore best suited for exporters of U.S. organic processed products like confectionary products, snacks, and baby food. More detailed information about the 2020 USDA-endorsed shows in Europe can be found at www.fas-europe.org
VII. Post Contact and Further Information

Internet home pages of potential interest to U.S. food and beverage exporters are listed below:

Annex

Current list of U.S. organic export HS codes

The first selected organic HS codes were introduced in 2011 in the Harmonized Tariff Schedule of the United States has not been able to keep up with the ever-expanding list of organic products available on the global market. Thus, there is a gap between actual trade and the data associated with HS organic codes. There is a different set for exports and imports of organic products. Less than four dozen organic products for U.S. exports have their own classification coding; everything else is not categorized as organic in this system. Over the years, the list of organic product groups tracked in the HS system has been expanded. The latest additional organic HS codes were introduced in 2018. Despite these shortcomings, the HS system provides a useful tool for tracking covered products and to track the export dynamics for those specific products.

2 The Harmonized Commodity Description and Coding System, also known as the Harmonized System (HS) is a standardized international system to classify traded products.
