

**Required Report:** Required - Public Distribution

**Date:** July 07, 2025 Report Number: UP2025-0021

# **Report Name:** Exporter Guide Annual

**Country:** Ukraine

Post: Kyiv

Report Category: Exporter Guide

**Prepared By:** Oleksandr Tarassevych

Approved By: Megan Francic

# **Report Highlights:**

Despite the Russia-Ukraine war, Ukraine's retail, food processing, and food service sectors are functioning. The retail industry is working to maintain an assortment of imported products. Fish and other seafood, beef, nuts, food ingredients, whiskey, beer, snacks, and pet food imports are growing. After the economy and imports contracted in 2022, the situation recovered in 2023-2024 and kept improving in 2025. Many imports recovered to pre-war levels. Decreased consumer purchasing power and a focus on cheaper product tiers have pushed many U.S. imports into the high-end segment. Ukraine is adopting numerous European Union (EU) import regulations to align its regulatory system as part of EU accession negotiations that started in July 2024. The import situation for food and agricultural products will remain dynamic, with logistics challenges, until the end of the war.

#### **Executive Summary:**

All sectors of Ukraine's economy have been impacted by the Russia-Ukraine war which began in February 2022. After a 29 percent drop in 2022 following the full-scale Russian invasion, the economy recovered by 5.3 percent in 2023 and an estimated 3.2 percent in 2024, with Ukraine's GDP growing to \$185 billion. In 2025, the World Bank expects GDP growth to weaken to 2 percent. Although Ukraine's imports of food and agricultural products dropped in 2022 by almost a third to \$6.3 billion, they rebounded to \$8.0 billion in 2024. Imports from the United States also declined in 2022 to \$191 million, but increased to \$283 million in 2024. The EU is Ukraine's major trading partner. Ukraine's major food and agricultural imports are tobacco, palm oil, pet food, wine, cheese, dairy, fresh fruits, miscellaneous food preparations, and sunflower seeds for planting.

Source: Trade Data Monitor

#### Food Retail Industry:

Ukraine's retail sales grew by 13 percent to \$54.2 billion (FAS/Kyiv estimate) in 2024 due to a slowdown in population outflow and stabilization of disposable incomes. Ukrainian chains are well-established, possess significant market power, and offer different retail formats and service levels for consumers of various incomes and preferences.

#### Food Processing Industry:

Ukraine restricted the publication of food processing industry indicators until the end of the war. Small and medium-sized enterprises dominate the market, with a few large processors responsible for the majority of sales in the beer, soft drinks, hard liquors, condiments, and confectionery sectors.

#### Food Service Industry:

The food service industry has suffered most significantly, with hotels and top-market segment restaurants with the highest losses. Ukraine restricted the publication of food service industry indicators until the end of the war.

# **Section I: Market Overview**

Although the Ukrainian economy has exhibited remarkable resilience, the immediate economic effects of Russia's 2022 full-scale invasion of Ukraine were very significant (Table 1). After a 29 percent GDP drop in 2022, the economy rebounded by <u>5.3</u> percent in 2023 and an estimated <u>3.2</u> percent in 2024. The World Bank expects 2025 performance to be mixed, as war-related spending depresses economic growth. The Ukrainian hryvnia has stabilized after a large devaluation in 2022 and remained stable after an exchange rate liberalization in 2023, facilitating imports of agricultural and food products. Food prices and rising salaries driven by a tightening labor market were the primary drivers of price growth in 2024 and prompted Ukrainian authorities to raise interest rates at the end of the year. Inflation in 2025 remains high at 5.6 percent through January to May, while the National Bank of Ukraine expects lower inflation by the end of the year. Due to population outflows resulting from the Russia-Ukraine war, Ukraine's consumer population decreased from 41 million pre-war to an estimated 30 million. Russia has hindered foreign trade by blocking ports in the Black and Azov Seas and attacking infrastructure. Direct foreign investment in Ukraine remains depressed due to war risks and currency repatriation concerns, and consumer spending is concentrated on necessities.

INDICATORS	2018	2019	2020	2021	2022	2023	2024

#### **Table 1: Major Economic Indicators**

Sources: World Bank; The National Bank of Ukraine; Ukraine's State Budget 2023; Trade Data Monitor <sup>1</sup> World Bank estimate

<sup>2</sup> FAS/Kyiv estimate

The food industry experienced a sharp drop due to falling consumer demand and other war-related factors, including logistics issues, after Russia's 2022 full-scale invasion of Ukraine, but quickly recovered in 2023 and 2024. In 2024, demand for most staple and mid-priced food products recovered to pre-war levels. There continues to be a strong demand for imports of tree nuts, fish, other seafood, beef, wine, beer, whiskey, and fresh, canned, and dried fruits. Demand for many high-end products remains sluggish.

Generally, lower-priced products and products with an optimal price/quality ratio will have a better sales outlook in all segments; however, quality requirements remain high, as the domestic industry competes with imports offering similar products at lower prices. U.S. suppliers should find a niche market for their products and be prepared to face competition from domestic suppliers and imports from the neighboring European Union (EU). Industry expects Ukraine's market may continue to focus on cheaper products until the war ends, while the food processing industry will likely see increased demand for imported ingredients as many are not produced domestically.

Ukraine's membership negotiations with the EU started in June 2024. Ukraine continues to implement regulatory reforms and has achieved some progress. Upon full membership, all import regulations should be in full compliance with the EU. Although new rules have made trade more transparent, the EU-like regulations have, in some cases, restricted market access for U.S. products. Following the start of the Russia-Ukraine war, new EU transit requirements came into force, as the only viable trade routes were through the EU, making exporting to Ukraine more unpredictable.

## **Population and Key Demographic Trends**

Russia's 2022 full-scale invasion of Ukraine precipitated the largest migration crisis in Europe since World War II. Close to one-quarter of the prewar population of 41.3 million (7.5-8.5 million refugees and migrants) fled Ukraine. Women and children are the core of the displaced population, as border crossing for the majority of men aged 18-60 is restricted due to martial law. Around 6.0 million people are internally displaced, mainly settling in the central and western areas of Ukraine. The Russia-Ukraine war has affected consumption for different groups in different ways. Employment for displaced people can be difficult, and the corresponding income losses have directly impacted consumption patterns. Many consumers maintain their consumption levels by using savings, which may be unsustainable longer term.

Pre-2022, a large number of Ukrainians (2.5-3.0 million) were employed abroad, and remittances were an important part of GDP (10.4 percent or \$12.2 billion in 2022), fueling consumer demand. Remittances dropped to \$9.4 billion in 2024 and continue to fall.

After a sharp income drop in the first half of 2022, disposable incomes grew strongly in 2023 and 2024 but remain below pre-war levels, with increased social transfers and military salaries offsetting modest economic recovery.

Advantages	Challenges
U.S. products are perceived as quality, high-end, unique products. Ukrainians have a positive attitude toward the United States.	Population outflow has resulted in market shrinkage. A decrease in consumer disposable income, high inflation, and unemployment of internally displaced people has led to a structural shift in consumption toward cheaper products.
Recent improved trade regulations, accompanied by anti-corruption efforts and a single window for importers, have simplified some customs procedures.	Arbitrary customs valuation practices can make importing food costly and complex.
Retail chains aim to diversify suppliers to maintain product assortment and a predictable supply of goods.	There is strong competition in the local market from domestic producers and increasing imports from the EU. Consumers tend to buy more "made in Ukraine" products, especially since the start of the Russia- Ukraine war.

#### Table 2: Advantages and Challenges Facing U.S. Products in Ukraine

The average import tariff level for consumer- oriented and processed food products is low	The Ukrainian regulatory framework, based on EU regulations, limits imports. Transit through the EU has become the only viable food import route, thereby imposing EU transit regulations on all imported products.

# **Section II: Exporter Business Tips**

#### **Local Business Customs**

Nearly all U.S. food and agricultural exporters work through Ukraine-based subsidiaries, importers, or buyers. Due to frequent changes in Ukrainian legislation, customs clearance rules, and sanitary, phytosanitary, and veterinary procedures, importers are typically responsible for the entire logistical chain and inland transportation. Imports by air are currently restricted, as Ukrainian airspace is closed. Imports by sea remain hindered, while imports via rail and road through western Ukraine are more viable and cost-effective.

Retailers possess significant market power. Mass-market products have a smaller chance of attracting an importer's attention than unique products. Exporters of high-value-added products must note that larger Ukrainian retail chains have very efficient product selection strategies. Many chains do not work with independent distributors; instead, they have their own importing departments, working directly with suppliers. They may start importing through a distributor and then later refuse distributor service and shift toward direct imports if sales potential appears to be good. Independent importers supply niche and new-to-market products with higher market risk. Independent distributors often face high shelving and marketing fees. Large national retailers are also effective in the development of private labels. Some retailers have multiple private label lines covering low-tier, mid-tier, and high-tier price categories. Importers may face unfavorable payment terms with money being paid 60 or even 90 days after product sale, which increases import costs and currency exchange risks.

#### **General Consumer Tastes and Trends**

While there are branches of international research companies that can provide paid, ad-hoc research, and some Ukrainian retailers have very sophisticated consumer data through their loyalty programs, Ukrainian market research for specific product groups can be difficult to access. Ukraine does not have large food trade shows.

Consumer preferences differ significantly across various incomes and age groups. Younger consumers tend to experiment with new products, but this often does not convert to long-term sales. Middle-aged and elderly consumers often treat new products with caution. Consumers of all ages and income groups

are highly patriotic in their choices and usually prefer domestic brands over imported ones, a trend that has strengthened due to the Russia-Ukraine war.

The geographic proximity to the EU influences Ukrainian consumer preferences. Ukrainian tourism in the EU, combined with the growing popularity of European cuisines, creates consumer demand. There are small convenience stores with imported EU products only, mostly in western Ukraine. At the beginning of the Russia-Ukraine war, many chains increased imports of substitutes for some domestically produced products (i.e., salt, baking powder, candies, pasta) from neighboring countries due to disrupted logistics and damaged infrastructure. Consumers recognize some foreign and well-established local geographical indications.

Ukrainians are familiar with organic products, but the term is often associated with or understood to be produced by small farmers or households. Consumers are familiar with the EU's Green Leaf logo, and it is officially accepted as equivalent to Ukraine's organic certification. USDA organic certification is not officially recognized. The concept of regional and local production is not popular in Ukraine; however, some upscale retail chains and restaurants promote local farms and companies.

The trend toward a health-conscious diet is emerging, mainly in urban areas and among high-income consumers, and Ukrainian consumers are paying more attention to the nutritional value of food products.

#### Section III: Import Food Standards, Regulations, and Procedures

FAS/Kyiv's Food and Agricultural Import Regulations and Standards (FAIRS) Country Report provides a detailed overview of Ukraine's import regulations. The report contains multiple links to specific FAIRS reports that explain import controls, labeling, place of origin, packaging, maximum residue levels for microbiological, radiological, and other contaminants, food additives, health and nutritional claims, organic and novel foods requirements, sample shipments, and import inspection procedures.

#### **Customs Clearance**

Imported products will not be granted clearance until all requirements are met. In 2018, Ukraine implemented a single window customs clearance system that allows for one-point document submission. For food safety clearances, an importer must submit a bill of lading for all products, an original shipment document, an original international certificate (veterinary or phytosanitary certificate when applicable), and a properly completed product entry document (Common Veterinary Entry Document for products accompanied by veterinary certificates or Common Entry Document for all other food products). Exporters should confirm the complete requirements of the customs clearance document package with their importer. Ukrainian is the only official language. All documents must be bilingual, submitted in Ukrainian, or accompanied by an official translation. Originals of all accompanying documents must be presented to the appropriate competent authorities before customs clearance of the product.

Ukraine returned to enforcing all laws and regulations governing commercial imports of food products, live animals, reproductive materials, seeds, and feeds on April 10, 2025. The Government of Ukraine suspended enforcement of these laws and regulations at the start of the Russia-Ukraine war in February 2022. Therefore, importers are expected to follow all official import procedures.

# Documents Generally Required by the Country Authority for Imported Food

All products of animal origin and seafood need to be accompanied by a bilateral health certificate, without exception. Detailed certification requirements by HS Code are listed in a <u>separate GAIN report</u>. For U.S. products, please refer to the <u>USDA FSIS Export Library</u> for specific products which can be exported to Ukraine. For the list of HS headings that need to be accompanied by international certificates, refer to the <u>FAIRS Certificate Report</u>. Processed food products imported into the customs territory of Ukraine must be accompanied by an "international certificate or another document issued by the exporting country's competent authority."

#### **Tariffs and Free Trade Agreements (FTAs)**

Ukraine has been modifying its food safety regulations to align with European regulatory norms since the signing of the <u>Deep and Comprehensive Free Trade Area Agreement</u> (DCFTA) that imposed additional compliance obligations for Ukrainian food safety rules in 2014. Several Ukrainian laws and regulations implemented after the DCFTA's adoption declared Ukraine's adherence to both "international and/or EU norms." Many U.S. products require bilateral certificates, which have been negotiated with Ukraine for market access. Ukrainian import duties are <u>generally low</u>, but many trading partners, including EU member states, the United Kingdom, Canada, and Türkiye, enjoy reduced import duties or zero import duty tariff rate quotas through various FTAs.

#### Section IV: Market Sector Structure and Trends

#### **Retail Sector**

Market share of organized retail trade, including supermarkets and convenience stores, exceeds 70 percent of Ukraine's domestic market. Small, family-owned shops account for over 20 percent, while open-air markets account for less than 7 percent, although their role in sales of raw pork, beef, and traditional dairy products remains significant. E-commerce is an emerging channel for food shopping. Historically, consumers have bought more non-food items than food products online; however, in big cities, consumers use grocery delivery, including services offered directly by retail chains, more often. Although a few new stores opened since 2022, most investments in the retail sector have stopped.

High rent costs and utility bills, substantial interruptions of supply chains, and prolonged electricity outages are among the main negative factors currently impacting retail operations. Retailers are forced to find alternative energy sources, such as generators, to maintain the necessary storage conditions, especially for fresh products.

The proportion of imports in wholesale and retail chains varies both by commodity group and the type of trade enterprise. From 2016 to 2021, imported food products increased their presence in retail sales from 18 to over 22 percent. Seafood, fresh and processed fruits, cheese, alcoholic beverages, coffee, and confectionery are the categories with the largest shares of imported products. Despite the Russia-Ukraine war, the retail sector provides the best sales opportunities for U.S. exports, due to stagnation in other sectors.

#### **Food Processing Sector**

In 2024, the Ukrainian food processing industry accounted for approximately 16 percent of total manufacturing and employed nearly 5 percent of the Ukrainian labor force. While the industry relies heavily on small and medium-sized enterprises, a few large processors are responsible for the majority

of sales. These large processors specifically dominate in the beer, soft drinks, hard liquors, condiments, and confectionery sectors. Ukraine also has well-developed dairy and poultry sectors. Due to Russia's 2022 full-scale invasion of Ukraine and corresponding manufacturing contraction, imports of intermediate agricultural products declined by almost 30 percent in 2022 and 2023 but bounced back with 14 percent growth in 2024 and early 2025.

## Hotel, Restaurant, Institutional (HRI) Sector

The HRI sector accounts for nearly 3 percent of total service industry turnover. At the start of the Russia-Ukraine war, many international food service chains suspended their operations but gradually resumed them within a few months. The state institutional sector is a significant consumer of food products. Schools, hospitals, the military, state penitentiaries, and other government institutions must follow Ukraine's common procurement guidelines (Prozorro). The use of the new centralized, more transparent procurement system significantly simplifies access to this market.

International tourist arrivals to Ukraine have largely stopped due to the Russia-Ukraine war. Domestic tourism is still in place, mainly focusing on cheaper formats.

Economic and energy stability are key challenges for the HRI sector. Establishments with generators have more potential to increase sales; however, the cost of generators is much higher, which impacts long term incomes and prices. Some industry representatives predict that restaurants will transform into cheaper formats and focus on quick service, fast delivery, and affordability instead of high-end interiors.

# **Section V: Agricultural and Food Imports**

Being one of the world's largest agricultural producers, Ukraine predominately imports food products that cannot be produced domestically for climatic or geographical reasons (tropical fruits, seafood, coffee, tea), sophisticated products for which domestic producers have little production competency (wine, pet food), or products complementing strong domestic production (dairy products, beer) (Figure 1).

Figure 1: Ukraine's Top 15 Agricultural and Consumer-Oriented Imports in 2024

Source: Trade Data Monitor Note: Total 2024 agricultural and consumer-oriented import value is \$6.4 billion

### **Best Product Prospects**

Ukraine imports many products from the United States, such as frozen fish and seafood, nuts, cereals, snacks, beef, food ingredients, and other prepared food products. Purchases of hake and Alaska pollock saw significant growth in 2024 as lower-priced fish options for retail and food service. Some products sold in small quantities will likely have substantial sales potential as Ukraine's economy recovers.

Demand for "healthy," "organic," and "natural" foods, as well as for niche products that target specific health issues, such as diabetes or gluten-free products, is strong in large urban areas. Likewise, demand is growing for vegetarian and vegan products. Before 2022, sales of high-quality and high-end food products were increasing. Seafood, high-end alcohol products, and quality beef products also have longer-term sales potential (Table 3). U.S. processed food, wine, and beverages have their target audience and potential to expand in the future.

Table 3: Best High-Value, Consumer-Oriented Product Prospects Categories*
